

Key Functions of Smart

Smart is a comprehensive platform designed to streamline the development and deployment of AI applications, enabling integration across various channels and facilitating team collaboration through workspaces and permission configurations.

Key function	Description
LLM Orchestration Support	- Support GPT-like models (including OpenAI, Qwen, and local LLMs). - Users can switch models per agent or tool to optimize for cost, latency, or performance.
Multi-Modal Agent Creation	- Build AI agents that can interact via text, buttons, links, rich cards, and more. - Visual builder allows users to orchestrate how agents should respond in various scenarios.
Reliable Workflow Development	Automate fixed and complex SOPs into reliable and step-by-step flows: - Automate repeating tasks - Build structured flows with logic + AI (e.g., content QC) - Ensure every step is traceable with full transparency
Prompt Management	- Define the agent' s role, goals, skills, constraints, and output style. - Use system prompts to anchor agent behavior consistently. - Incorporate variables and fallback strategies.
Knowledge Base Integration	- Create and manage centralized knowledge documents. - Agents can reference KBs during conversations for accurate and consistent answers. - Supports chunking, vector search, and relevance ranking.
Tool Calling & Function Integration	- Agents can invoke external tools/APIs using JSON-based schemas (Smart "tools"). - Seamlessly integrate backend systems, internal data sources, or 3rd-party APIs.
User Input Handling	- Capture structured inputs like text, numbers, selections, or file uploads. - Useful for form-like interactions or guided processes.
Testing & Debugging	- Real-time preview panel for testing how agents respond to various inputs. - Track and visualize tool execution, variable flow, and output paths.
Analytics & Logs	- View agent usage metrics: session counts, message flow, tool usage. - Inspect detailed logs for debugging or training data improvements.
Multi-Channel Deployment	Release agent and workflow to multiple channels: - Live App, dedicated web app with secured access control - SeaTalk. - Custom websites or external apps via APIs. - Scheduled Trigger, schedule agent to run regularly.
Collaboration & Publishing Control	- Share agents with teams or specific users. - Manage draft vs. live versions, publishing history, and access permissions.
