

Smart Platform Overview

Smart (Sea Multi-Agent Realisation Technology) is Sea Group's internal AI agent platform that enables teams to build, debug, deploy, and scale AI agents powered by large language models (LLMs).

Smart supports single-agent, multi-agent, and workflow-based AI architectures, and provides seamless integration with tools, knowledge bases, and end-to-end business workflows. It is designed to work equally well for rapid prototyping and experimentation, while scaling to production-grade agentic systems for mission-critical use cases.

In accordance with company policy, Shopee and Monee teams should use Smart as the primary platform for AI use cases and workflows, especially for official and production projects.

Key Capabilities

AI Assets Marketplace with Secure RBAC

Smart enables teams to publish and share multi-agents, workflows, knowledge bases, and tools through an internal AI assets marketplace. Fine-grained, secure RBAC (Role-Based Access Control) ensures teams have full control over what they share, preventing unintentional data leaks while promoting reuse and collaboration across the organization.

Composable Multi-Agent & Workflow Architecture

Agents and workflows can seamlessly call and orchestrate one another, enabling complex, modular, and reusable AI systems. This composability allows teams to build scalable agent ecosystems rather than isolated solutions.

Scale & Adoption

Smart currently hosts:

- **10,000+ released multi-agents**
- **2,000+ released workflows**
- More than half of these assets are actively released and in use across teams

This demonstrates strong cross-functional adoption and production-level trust in the platform.

Flexible Integration Options

Smart supports multiple integration patterns to fit diverse business needs:

- Seataalk integration
- Live Web App interfaces
- Agent-as-API
- Workflow-as-API

These options allow Smart agents to be embedded directly into existing operational systems and user touchpoints.

Production-Ready Features

Smart provides enterprise-grade operational capabilities, including:

- User feedback collection mechanisms
- Release history tracking
- Version rollback support
- Batch evaluation frameworks
- Observability and debugging tooling

These features ensure reliability, governance, and continuous improvement in production environments.

Advanced Memory & Context Management

Smart includes cutting-edge capabilities such as:

- Customizable short-term memory for precise context control
- Long-term memory mechanisms to enable continuous improvement and knowledge accumulation over time

Robust Knowledge Base System

Smart offers a highly configurable knowledge infrastructure:

- Customizable embedding and chunking strategies
- Support for uploading all common file types
- Integration with Data Suite Hive tables
- Automated periodic website crawling
- Scalable retrieval mechanisms

This enables teams to build accurate, context-aware agents grounded in enterprise data.

User-Friendly Across Skill Levels

Smart is designed to serve a wide range of users:

- Business and non-technical users
- Semi-technical workflow designers
- Highly technical engineers building complex agent systems

Its intuitive interface lowers the barrier to AI adoption while retaining the depth required for advanced customization.
