- 3. Why Smart?
- 4. Who is Smart for?

1. What is Smart

Smart (SEA Multi-Agent Realisation Technology) is Sea Group's internal AI agent platform that enables teams to **build, debug, and deploy AI agents** powered by large language models (LLMs). Smart supports **single-agent, multi-agent, and workflow-based AI architectures**, and provides seamless integration with tools, knowledge bases, and end-to-end business workflows. You don't need to be a programmer to create powerful AI-driven solutions as Smart is designed to be a no-code/low-code platform for fast prototyping and business deployment without needing to write backend code.

In accordance with company policy, **Shopee and Monee teams should use Smart as the primary platform** for AI use cases and workflows, especially for **official and production projects**. For using other platform products to build AI agents, please check with your team management or contact Smart platform team for supports.

2. How does it work?

Smart works by combining structured system prompts, visual workflow design, and external tool integrations to create intelligent, task-specific agents. Users define an agent's role, objectives, and logic, and can connect the agent to APIs or internal systems using built-in "tools." It also supports a knowledge base feature, allowing agents to reference structured documents for accurate and consistent answers. Once built, agents can be tested, deployed across various platforms (like web or SeaTalk), and monitored with real-time logs and analytics—all without writing backend code.

Key modules include:

Module	Purpose
Agent	Central logic and persona of the AI assistant
Prompt	System message to guide LLM behavior
Tools	External functions the agent can call
Knowledge Base	Static docs agents can retrieve from
Deployment	Connect to real-world channels
Analytics	Track usage, errors, tool calls

3. Why Smart?

Comprehensive official tools to access internal data

Smart offers built-in official tools to access company data stored in internal systems and data warehouse.

- **Centralised governance:** Tools are provided by certified departments, follows internal compliance and security protocols.
- **Easy access:** Access data by filling the information in a window, no code needed.

Multi-agent for complex problem solving

Smart supports multi-agent architecture, enabling different teams to create specialised agents. These agents can be combined to solve complex business problems

- **Cross function:** Specialized agents from different teams can work together to address company-wide challenges.
- **Win in the long run:** Agents can be reused and improved over time, creating a growing library of problem-solving capabilities.

By the company, for the company

Smart is designed for the company's business needs, and ensures good user support and faster alignment with business objectives.

- **Customised solutions:** The platform evolves based on direct feedback from internal users and business units.

- **Dedicated Support:** Professional platform team provides onboarding, training, and technical support.

4. Who is Smart for?

These are the stakeholders or end users across organization who benefit from the AI agents:

Domain	Role	Examples
Commercial	BD, Marketing	• AI Campaign Assistant: Generates personalized email campaigns and ad copies. • BD Intelligence Agent: Summarizes competitor activity and customer insights from CRM. • Proposal Generator: Auto-creates sales proposals based on client profiles.
Ops	CS, BPO, RR Ops	• Support Chat Agent: Handles Tier 1 inquiries and routes complex cases. • Order Management Bot: Responds to logistics or fulfillment queries automatically. • SOP Validator: Parses process documents and flags inconsistencies or gaps.
BI	Local/ Reg BI, Marketing Analytics, Product Analytics	• BI Knowledge chatbot: BI Metrics Definition, Calculation and Source table suggestion • BI Data Pulling: SQL code generation and suggestion • BI Alert: Biz metrics Issue Detection and Escalation
Corporate	Compliance, HR, legal	• Compliance Policy Q&A Agent: Answers employee questions on internal policies. • Contract Review Assistant: Extracts risks and summaries from legal documents. • HR Onboarding Agent: Guides new hires through documentation and FAQs
Product	PM, Product Design	• UX Feedback Analyzer: Summarizes user testing transcripts and sentiment. • Content Ideation Agent: Suggests feature names, or UX microcopy. • Prototype Companion: Describes UI changes and feature logic in natural language for non-designers.
Tech	Dev, Engineer	• API Testing Agent: Generates and validates test cases from API docs. • Code Explainer Bot: Translates code logic into plain English (useful for reviews). • DataOps Agent: Summarizes logs, flags anomalies, or automates SQL query creation
